As part of CIE’s continual commitment to maintaining best practice in assessment, CIE uses different variants of some question papers for our most popular assessments with large and widespread candidature. The question papers are closely related and the relationships between them have been thoroughly established using our assessment expertise. All versions of the paper give assessment of equal standard.

The content assessed by the examination papers and the type of questions is unchanged.

This change means that for this component there are now two variant Question Papers, Mark Schemes and Principal Examiner’s Reports where previously there was only one. For any individual country, it is intended that only one variant is used. This document contains both variants which will give all Centres access to even more past examination material than is usually the case.

The diagram shows the relationship between the Question Papers, Mark Schemes and Principal Examiners’ Reports that are available.

<table>
<thead>
<tr>
<th>Question Paper</th>
<th>Mark Scheme</th>
<th>Principal Examiner’s Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduction</td>
<td>Introduction</td>
<td>Introduction</td>
</tr>
<tr>
<td>First variant Question Paper</td>
<td>First variant Mark Scheme</td>
<td>First variant Principal Examiner’s Report</td>
</tr>
<tr>
<td>Second variant Question Paper</td>
<td>Second variant Mark Scheme</td>
<td>Second variant Principal Examiner’s Report</td>
</tr>
</tbody>
</table>

Who can I contact for further information on these changes?
Please direct any questions about this to CIE’s Customer Services team at: international@cie.org.uk

The titles for the variant items should correspond with the table above, so that at the top of the first page of the relevant part of the document and on the header, it has the words:

- First variant Question Paper / Mark Scheme / Principal Examiner’s Report

or

- Second variant Question Paper / Mark Scheme / Principal Examiner’s Report

as appropriate.
1 (a) Using straight lines, match the names of the flower parts with their functions. One has been completed for you.

- **anther**: allows the passage of the pollen tube to the ovary
- **petal**: attracts insects for pollination
- **sepal**: produces pollen grains
- **style**: protects the flower when in bud
- **stigma**: the surface on which the pollen lands during pollination

(b) Describe how the stigmas of wind-pollinated flowers differ from the stigmas of insect-pollinated flowers. Relate these differences to the use of wind as the pollinating agent.

(c) Discuss the implications to a species of self-pollination.
2 The wild dog is one of the smaller African carnivorous mammals. It has disappeared from 25 of the 39 countries where it used to live. Wild dogs hunt in packs, feeding on antelopes, which are grass-eating mammals.

A conservation programme has been started to increase the wild dog population in South Africa. Farmers are worried about numbers getting out of control because wild dogs breed at a very fast rate. However, conservationists are not concerned because the lion is a natural predator of the dogs.

(a) Wild dogs are carnivorous mammals.

(i) Define the term carnivore.

(ii) State one external feature which distinguishes mammals from other vertebrates.

(b) (i) Suggest two reasons why numbers of African wild dogs are decreasing.

1. ..............................................................

2. .............................................................. [2]

(ii) Suggest what could happen to the species if numbers continue to decrease.

.............................................................. [1]

(c) Using the information in the passage above, construct a food chain for a wild dog, including its predator.

Label each organism with its trophic level.
(d) It is important that the wild dog species is conserved.

(i) Explain the meaning of the term conservation.

(ii) Outline the measures that could be taken to conserve a mammal, such as the wild dog.

(e) When wild dogs die, nitrogen compounds in their bodies may become available for plants. Outline the processes that occur to make these nitrogen compounds in the bodies of dead animals available for plants to absorb.

[Total: 19]
Catalase is an enzyme found in plant and animal cells. It has the function of breaking down hydrogen peroxide, a toxic waste product of metabolic processes.

(a) (i) State the term used to describe the removal of waste products of metabolism.

(ii) Define the term enzyme.

An investigation was carried out to study the effect of pH on catalase, using pieces of potato as a source of the enzyme.

Oxygen is formed when catalase breaks down hydrogen peroxide, as shown in the equation.

\[
\text{hydrogen peroxide} \rightarrow \text{catalase} \rightarrow \text{water + oxygen}
\]

The rate of reaction can be found by measuring how long it takes for 10 cm\(^3\) oxygen to be collected.

(b) (i) State the independent (input) variable in this investigation.

(ii) Suggest two factors that would need to be kept constant in this investigation.

1. 
2. 
Table 3.1 shows the results of the investigation, but it is incomplete.

**Table 3.1**

<table>
<thead>
<tr>
<th>pH</th>
<th>time to collect 10 cm³ oxygen / min</th>

(c) Calculate the rate of oxygen production at pH 8.

Show your working. Write your answer in Table 3.1
(d) Complete the graph by plotting the rate of oxygen production against pH.

(e) (i) Using data from the graph, describe the changes in the reaction rate between pH 4 and pH 8.

(ii) Explain the change in the reaction rate between pH 6 and pH 8.
Fig. 4.1 shows three species of zebra.

Equus burchelli

Equus grevyi

Equus zebra

Fig. 4.1
(a) Describe one method a scientist could use to show that the zebras shown in Fig. 4.1 are different species.

(b) Studies have shown that the hotter the environment, the more stripes zebras have.
(i) State the type of variation which would result in different numbers of stripes.
(ii) Study Fig. 4.1. Suggest which species of zebra lives in the hottest environment.

(c) Occasionally, zebras are born that are almost completely black. The change in appearance is the result of mutation.
(i) State the term that is used to describe the appearance of an organism.
(ii) Define the term mutation.
(d) Tsetse flies attack animals with short fur, sucking their blood and spreading diseases. Fig. 4.2 shows a tsetse fly. This fly is an insect, belonging to the arthropod group.

![Fig. 4.2](image)

(i) State one feature, visible in Fig. 4.2, which is common to all arthropods.  
........................................................................................................................................... [1]

(ii) State two features, visible in Fig. 4.2, which distinguish insects from other arthropod groups.

   1. ...........................................................................................................................................  
   2. ...........................................................................................................................................  [2]

(e) Scientists have discovered that zebras with more horizontal stripes attract fewer tsetse flies.

(i) Suggest why the stripes on the head and neck of the zebra would be an advantage when it feeds on grass on the ground.

...........................................................................................................................................  
........................................................................................................................................... [2]

(ii) Describe how a species of zebra could gradually develop more horizontal stripes.

...........................................................................................................................................  
...........................................................................................................................................  
...........................................................................................................................................  [3]

[Total: 14]
5 To stay healthy we need a balanced diet.

(a) Define the term *balanced diet*.

Protein is one nutrient present in a balanced diet. The body cannot store protein, so any excess amino acids are broken down in the process of deamination, as shown in Fig. 5.1.

(b) (i) Name the organ where deamination takes place.

(ii) Compound X is used as an energy source in respiration.

Suggest the name of compound X.
(iii) State the type of respiration shown in Fig. 5.1.

Explain your answer.

<table>
<thead>
<tr>
<th>type of respiration</th>
<th>explanation</th>

</tbody>
</table>

[8]

(e) The volume of blood filtered by the kidneys is 1.18 dm\(^3\) min\(^{-1}\).

(i) Calculate the total volume of blood filtered in 24 hours.

Show your working.

\[
\text{volume} = ........................................... \quad [2]
\]

(ii) If the total volume of urine produced in 24 hours is 1.7 dm\(^3\), calculate the percentage volume of the filtered blood excreted as urine in 24 hours.

Show your working.

\[
\% \text{ volume} = ........................................... \quad [2]
\]

- **style**: protects the flower when in bud
- **stigma**: the surface on which the pollen lands during pollination

(b) Describe how the stigmas of wind-pollinated flowers differ from the stigmas of insect-pollinated flowers. Relate these differences to the use of wind as the pollinating agent.

(c) Discuss the implications to a species of self-pollination.

[Total: 10]
Fig. 2.1 shows *Salvinia molesta*, which is an Australian freshwater plant, introduced to the wetlands of Namibia as a source of animal food. However, in Namibia the plant reproduces much more quickly than in Australia. It quickly covers the surface of the water.

(a) Scientists are concerned about the environmental damage caused by *S. molesta* to the aquatic habitats in the ecosystem of the Namibian wetlands.

(i) Define the term *ecosystem*.

(ii) Outline how *S. molesta* could damage the aquatic habitats of the wetland ecosystem.
(b) *S. molesta* is being controlled using an Australian beetle, *Cyrtobagous saliniae*. The beetle eats the growing points of the plant.

Suggest and explain why

(i) it is better to use a natural consumer of the plant than to apply herbicides in the water to kill it,

(ii) it could be dangerous to the wetland ecosystem to introduce Australian beetles.

(c) The growth of *S. molesta* is now under control.

Its population growth has followed the pattern of a sigmoid curve.

(i) Using the axes below, sketch a sigmoid growth curve for *S. molesta*.

(ii) Label the phases of the sigmoid growth curve.

(iii) Using the information given in this question (pages 3 and 4), state **one** factor that is limiting the growth of *S. molesta*.
(iv) Explain how two other named factors could also limit the growth of *S. molesta*.

1. ........................................................................................................................................ [4]
2. ........................................................................................................................................ [4]
